

# 1 Section: text example with a float

Words and characters of this example file are automatically counted from the source file when compiled (therefore generated text as \lipsum[1-10] is **not** counted). The results are showed at the end of the compiled version. Counts are made in headers, caption floats and normal text for the whole file. Subcounts for structured parts (sections, subsections, etc.) are also made. Number of headers, floats and math chunks are also counted.

This is only a example float

Figure 1: This is a example caption

## 1.1 Subsection: Little text with math chunks

In line math:  $\pi + 2 = 2 + \pi$

Display math:

$$\pi + 2 = 2 + \pi$$

.....End of the example .....

**Counts of words**
